SizingPathGeneration(set1)

    foreach leaf cell **cella** in **set1**

        find all the half-operators in **cella** that are going to start a path, put in seta

        foreach half-operator **hoa** in **seta**

            lsta is an empty list of half-operators

            RecursivePaths(**lsta, hoa**)

RecursivePaths(lst1, ho1)

    If (**lst1** contains **ho1**) make sizing-path from **lst1**, then return   // found cycle

    If (**ho1** drives an observable point) make sizing-path from **lst1** and **ho1**, then return

    foreach **hoa** that is driven by **ho1** and has opposite driving direction of **ho1**
RecursivePaths(**lst1+ho1, hoa**)

CatPathGeneration(set1)

    lsta is sorted list of mid-level cells in **set1**, from low to high (e.g. from mid to top levels)

    foreach **cella** in **lsta**

        // N.B. an nonobservable sucells is a subcell which contains

        // a nonobservable point

        pop up paths from nonobservable subcells of **cella** to **cella**

        find all the paths in **cella** that are going to start a cat-path, put in **seta**

        foreach **patha** in **seta**

            lsta is an empty list of paths

            RecursiveCatPaths(**lsta**, **patha**)

RecursiveCatPaths(**lst1**, **path1**)

    if (**lst1** contains **path1**) make cat-path from **lst1**, then return   // found cycle

    if (last half-operator of **path1** drives an observable point)

        make cat-path from **lst1** and **path1**, then return

    foreach **patha** that is driven by **path1**

RecursiveCatPaths(**lst1**+**path1**, **patha**)
